

MK43 Ultra / AERA — Dot Notation Evolution Operator Addendum

This document extends the canonical MK43 Ultra symbolic topology grammar to include the recursive evolution operators used within the tensor inheritance pipeline. The purpose of this addendum is to formalize recursive tensor propagation, continuity inheritance, stabilization logic, redistribution behavior, closure convergence, and normalization mechanics entirely within the canonical dot notation framework.

Canonical Evolution Operators

$\cdot\cdot$ — Inherit

Canonical meaning: preserve prior continuity adjacency during recursive stage propagation.

$\cdot\cdot$ — Propagation

Canonical meaning: traversal, movement, recursive field-state advancement.

$\cdot^\circ$ — Stabilization

Canonical meaning: drift resistance, inertial lock, recursive persistence retention.

$\cdot\cdot\cdot^\circ$ — Redistribution

Canonical meaning: directed occupancy flow through density-bearing topology.

$\cdot\cdot^\circ\cdot^\circ$ — Destabilization

Canonical meaning: collapse pressure, boundary weakening, recursive continuity failure.

$\cdot^\circ$ — Closure

Canonical meaning: convergence realization, attractor completion, bounded continuity closure.

■ $\cdot\cdot$ ■ — Normalize

Canonical meaning: anchored continuity rebalance, bounded recursive re-centering, stabilization checkpoint alignment.

Tensor Evolution Semantics

The MK43 Ultra tensor is treated as a recursively inherited field-state object. The tensor does not consist of disconnected snapshots. Instead, each recursive stage inherits from the previous stage according to the canonical evolution operators. $\text{Tensor}_{(t+1)}$ inherits from Tensor_t . The recursive evolution pipeline therefore operates as: inherit $\rightarrow$ propagate $\rightarrow$ stabilize $\rightarrow$ redistribute $\rightarrow$ close $\rightarrow$ normalize. Destabilization is treated as recursive continuity divergence that exceeds bounded stabilization thresholds.

Canonical Pipeline Interpretation

The T4 $\rightarrow$ T5 region remains the primary persistence-thickening window within the pipeline. The T5 $\rightarrow$ T6 region governs stabilization retention and redistribution resistance. The T6 $\rightarrow$ T7 region governs occupancy closure realization and recursive continuity convergence. The evolution operators are not treated as decorative symbolic notation. They represent canonical recursive topology grammar used to describe tensor inheritance behavior.

Language Constraint Statement

The MK43 Ultra dot notation language is append-only. Future operators should emerge from recursive compositional reuse of existing notation whenever possible. Expansion of the symbolic language should remain bounded, coherent,

topology-first, and continuity-preserving. The objective is not symbolic complexity. The objective is recursive interpretability.
